Grinin et al. (2010); Demidova et al. (2010)

Rostopchina et al. (2006); Demidova et al. (2010)

Shahkovskoi et al. (2005); Demidova et al. (2010)

# The density waves in the circumstellar disk (model $q = 0.1$ , $e = 0.3$ , $i = 5^\circ$ ):

Two spiral arms arise when the companion pass by the pericenter and its disappear after the companion pass by the apocenter.

Similar results: Nelson (2000); Kley & Nelson (2008)

# The column density in the circumstellar disk (model $q = 0.1$ , $e = 0.3$ , $i = 0^\circ$ , $\theta = 10^\circ$ ):

$10^\circ$  is the maximum inclination where the noticeable number of particles lies on the line of sight for the model with the companion orbit coplanar to the disk plane.

# The precession of the circumstellar disk (model $q = 0.1$ , $e = 0.3$ , $i = 5^\circ$ , $\varphi = 0^\circ$ , $\theta = 10^\circ$ ):

# The precession of the circumstellar disk (model $q = 0.1$ , $e = 0.3$ , $i = 5^\circ$ , $\varphi = 0^\circ$ , $\theta = 10^\circ$ ):

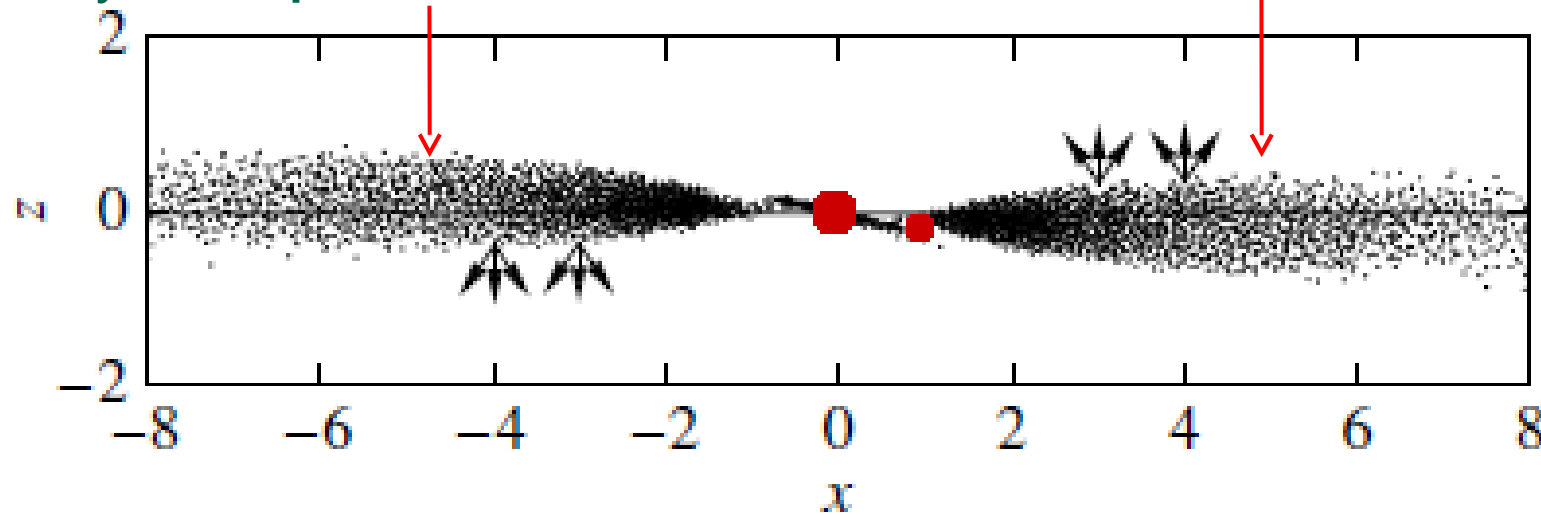

# The idea about asymmetric illumination of the outer part disk: Demidova et al. (2013); Demidova & Grinin (2014)

Cold area are shielded  
by the warped disk

Warm area are illuminated  
by the direct stellar radiation

# The disk surface definition

Vertical density distribution

$$\rho_z = \rho_0 \cdot e^{-z^2/h^2}$$

Surface density

$$\Sigma_z = \int_z^\infty \rho_z dz$$

Optical depth

$$\tau = \Sigma_z \cdot \kappa$$

$\kappa$  – Opacity

Natta & Whitney (2000)

# The calculation of the disks images

Tambovtseva et al. (2006); Demidova & Grinin (2014)

## Direct radiation

$$F_s(r', \phi', z') = \frac{L_* e^{-\tau(r', \phi', z')}}{4\pi(r'^2 + z'^2)}$$

## Scattered light

$$F_{sc}(r, \phi, z_1) = k_{sc} \int_0^{2\pi} d\phi' \int_{r_s}^{5a} r' dr' \int_{z_1}^{z_2} \frac{F_s(r', \phi', z')}{4\pi|\vec{d}|^2} \rho(r', \phi', z') f(\theta) e^{-\tau(r', \phi', z', r, \phi, z_1)} \cos \xi dz'$$

## Temperature

$$T = \sqrt[4]{F/\sigma}$$

## Luminosity

$$L_\lambda = \sum_{\lambda} B_\lambda(T) \cdot g_\lambda$$

# $LkH\alpha 101$

$$L_* = 1300L_{\odot}$$

Tuthill et al. (2002)

Demidova et al. (2014)

# Collaboration with S.Wolf group

**Method** – the Monte Carlo-based full 3D continuum radiative transfer code MC3D (Wolf 2003; Wolf et al. 1999).

**Dust** – spherical dust grains: 62.5% silicate, 37.5% graphite  
density of dust:  $\rho_d = 2.7 \text{ g/cm}^3$   
dust grain size distribution:  $n(a) \propto a^{-2.5}$   
 $a \in [0.005 \mu\text{m}, 100 \mu\text{m}]$   
Ice is not considered.

## Primary component

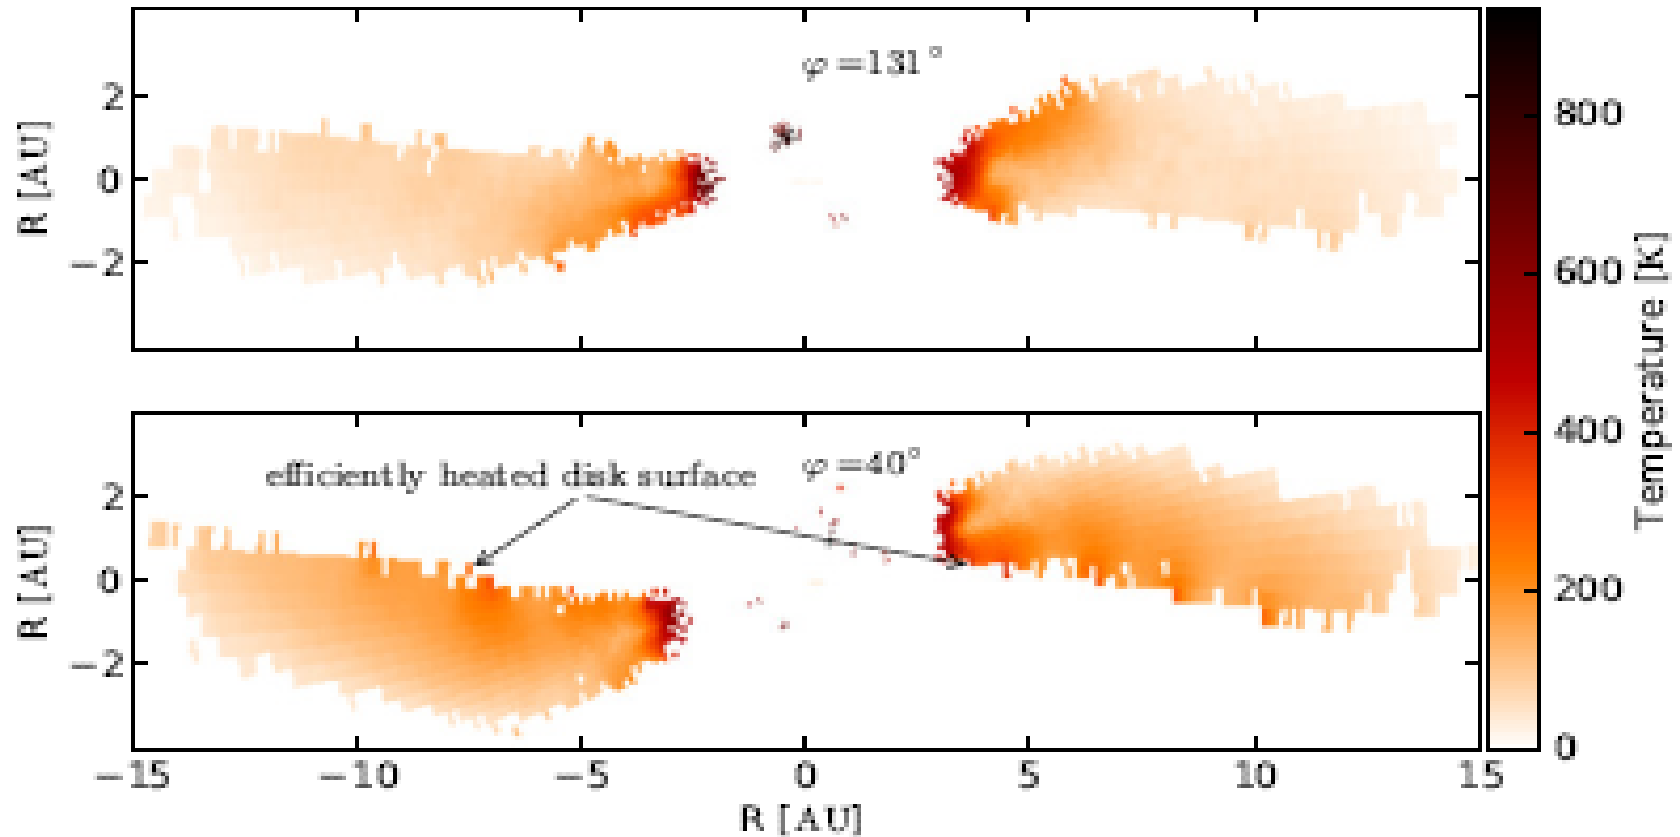

- Herbig Ae star
- mass:  $M = 2 M_{\odot}$
- luminosity:  $L = 43 L_{\odot}$
- temperature:  $T = 9500 \text{ K}$

## Secondary component

q	L [ $L_{\odot}$ ]	$T_{\text{eff}}$ [K]	M [ $M_{\odot}$ ]
1	43	9500	2.5
0.5	0.95	4000	1.25
0.1	0.7	4000	0.25
0.01	0.003	2700	0.025

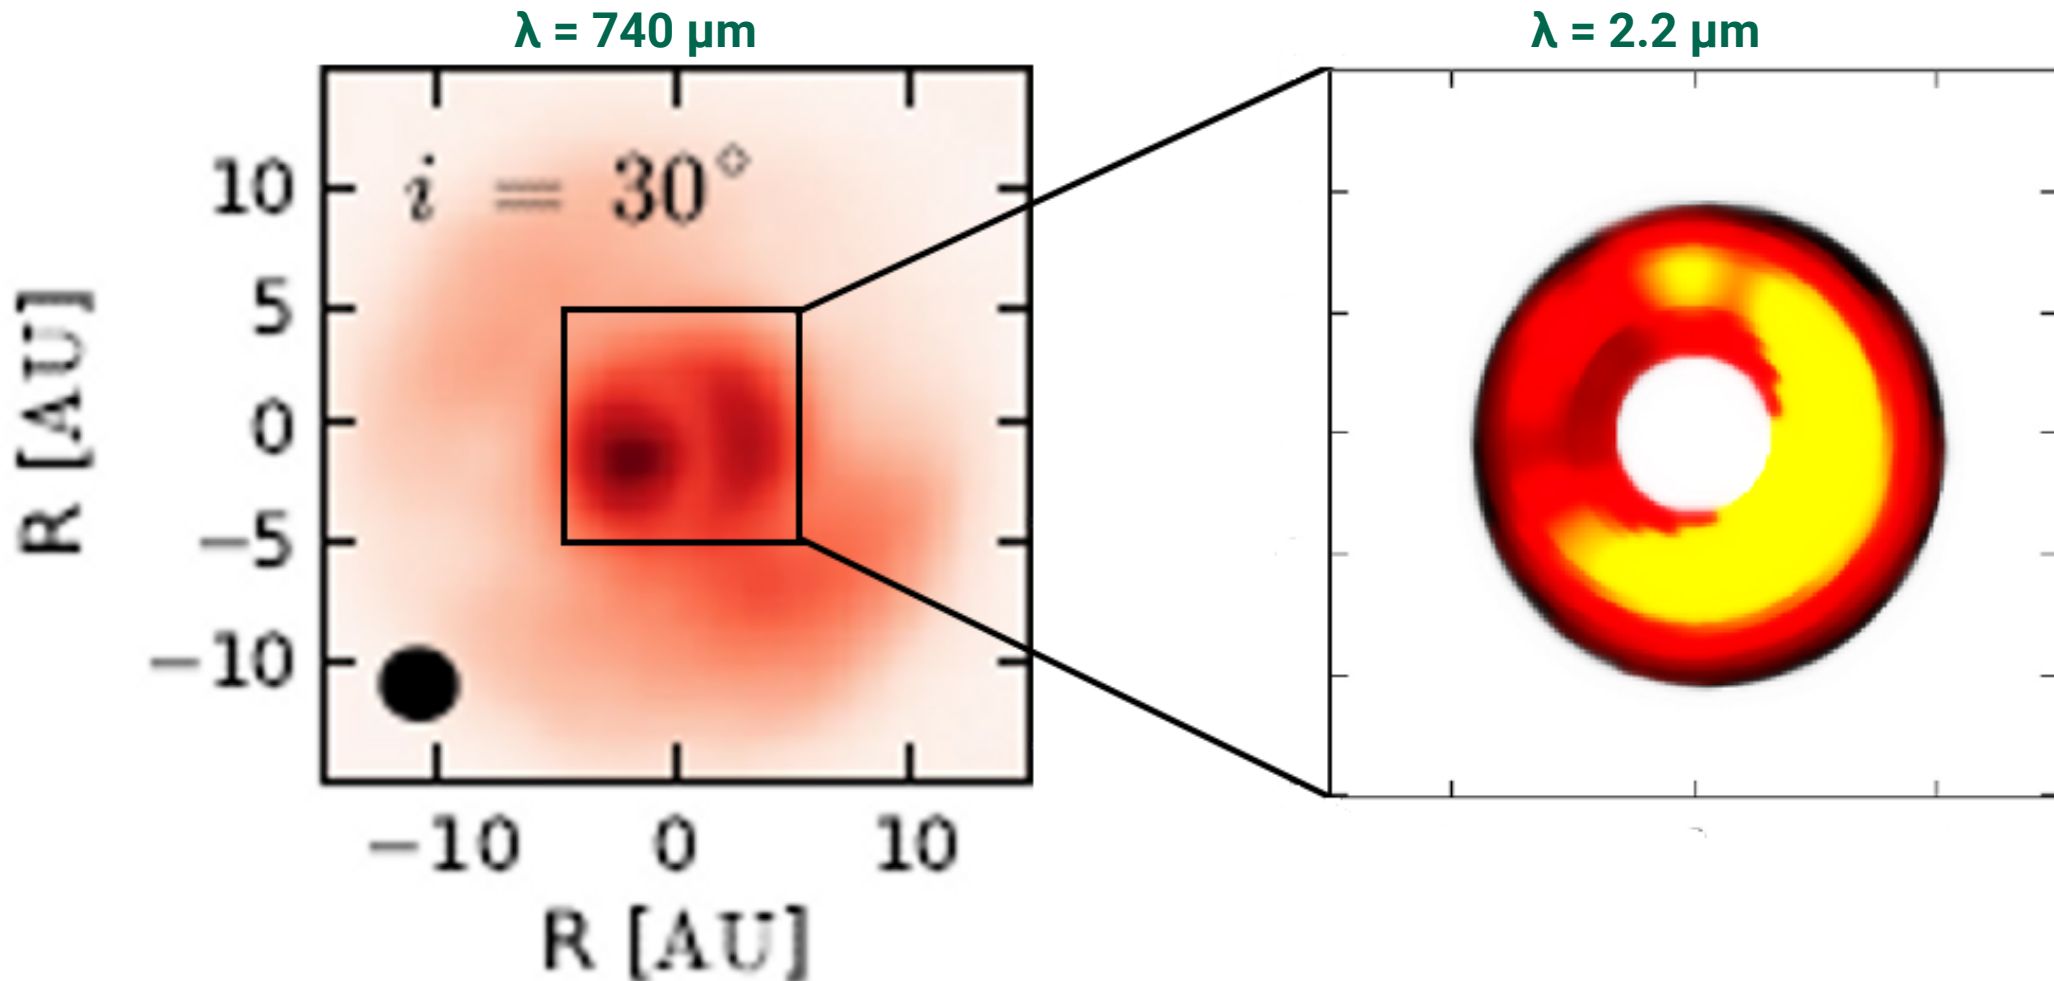

Semimajor axis of the component orbit  $a = 2 \text{ AU}$

# The temperature distribution in the inclined model

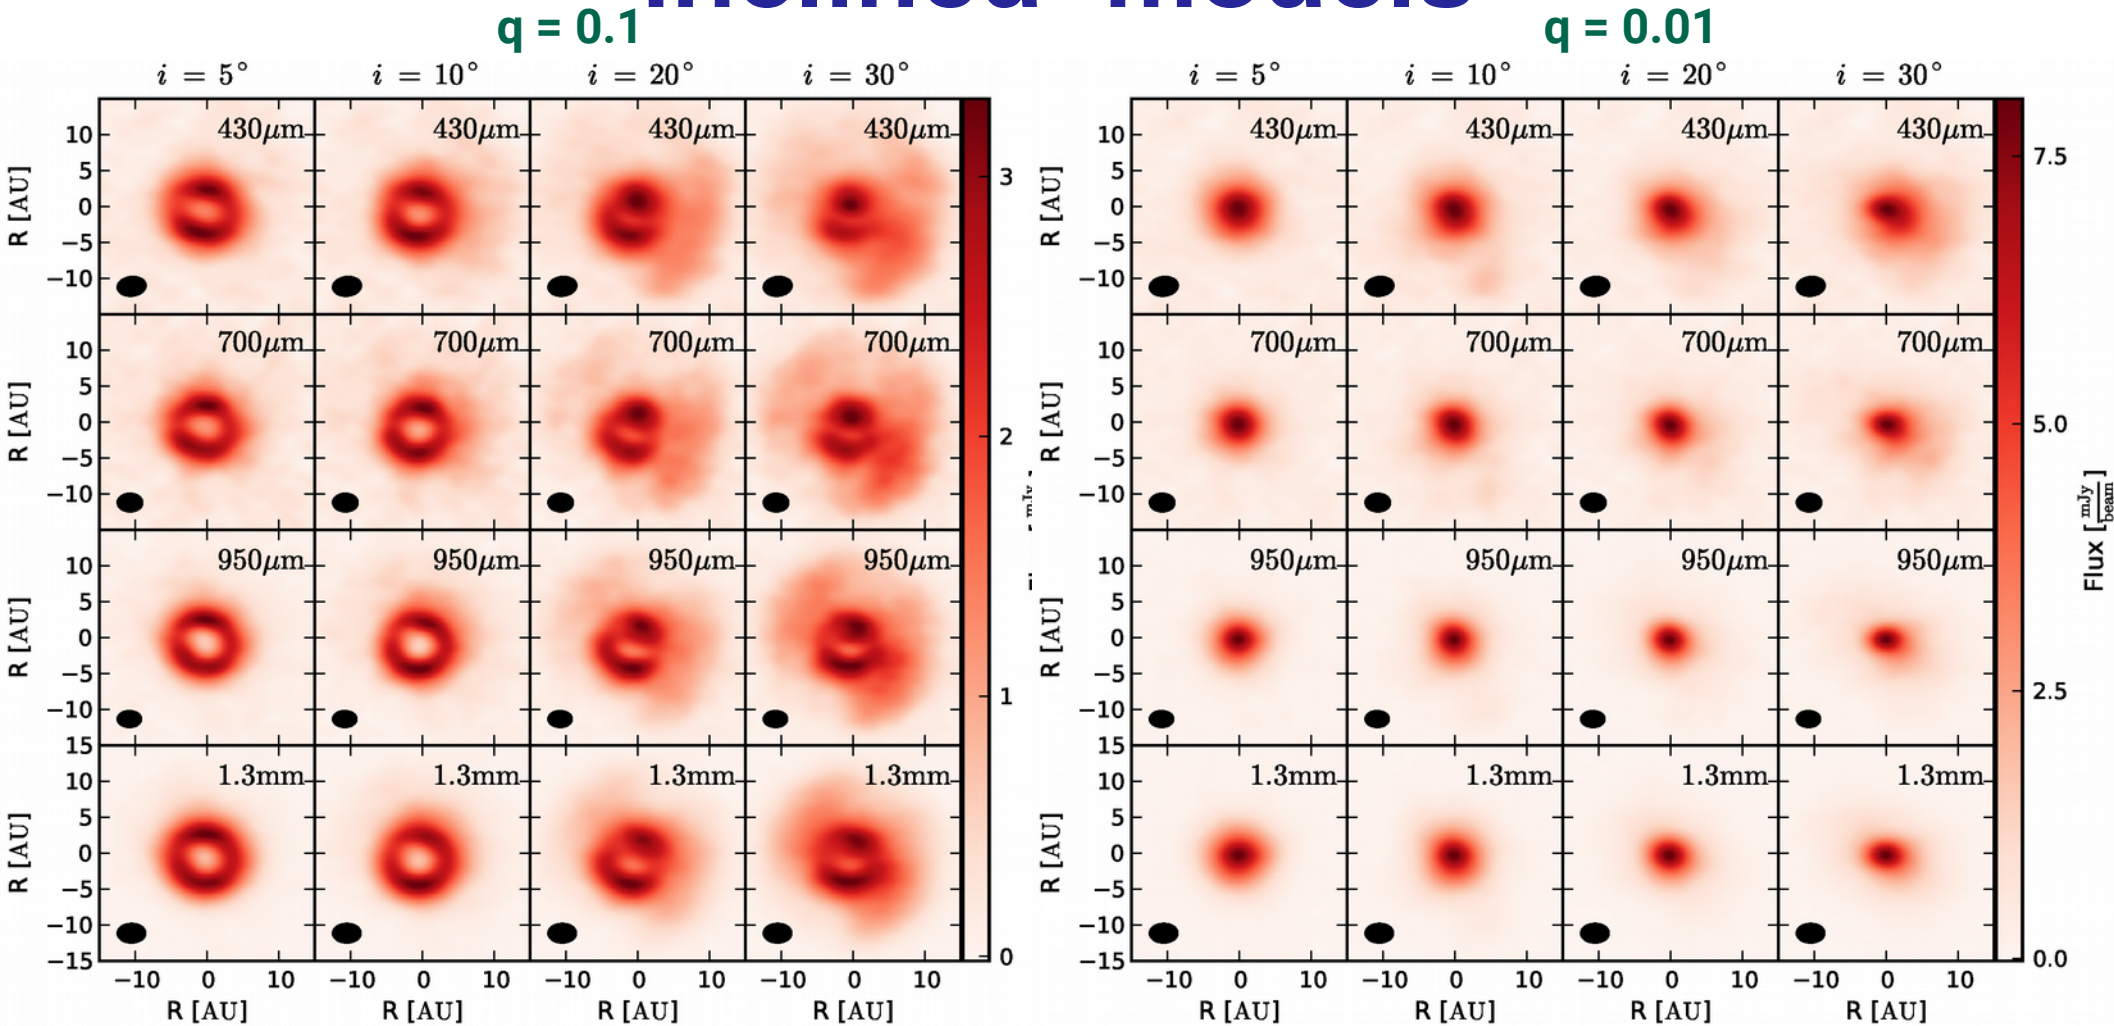

Temperature maps along vertical cuts through the density distributions of the disk model with the parameters:  $q = 0.1$ ,  $i = 30^\circ$ ,  $e = 0$

# The comparison of the images in IR and radiowaves in the inclined model: Ruge et al. 2015

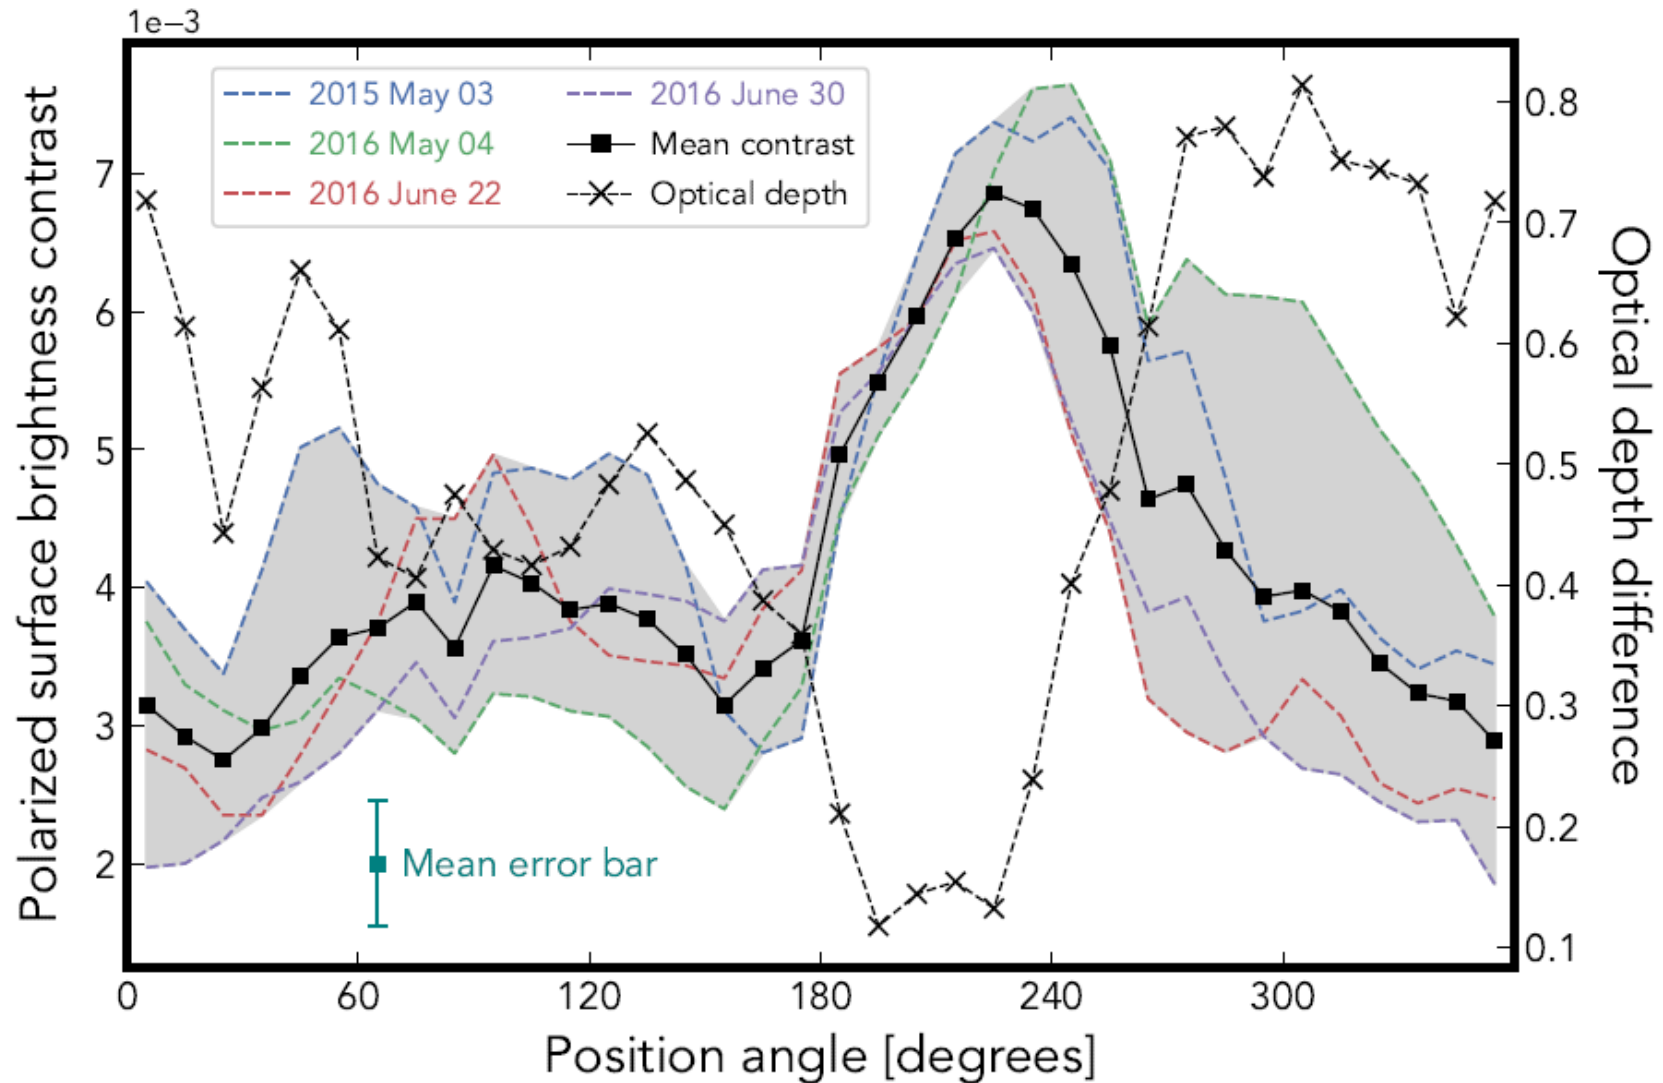

The images in IR band show the inner warm part of the disk, but the radio images can demonstrate the outer part of the disk. Disk is optically thin in radio waves and warm region shielded from an observer can shine through the disk. The “butterfly”-shaped images can be observed. Similar results: Arzamasskiy et al. (2018); Zhu (2018).

# Predicted images with ALMA for the inclined models

If  $q = 0.1$  the simulated observations appear as rings at low inclinations. This aspect is destroyed if  $i > 10^\circ$ . If  $q = 0.01$  the perturbations induced by the component into the disk are not strong enough to be detected in the simulated observations.

# Quasi-stationary shadow on the disk

HD 135344B, Stolker et al. (2017)

# Conclusions

Signature of an invisible low-mass companion:

- 1) The cyclic brightness variations of UX Orion type stars;
- 2) Quasi-stationary shadow on the disk image;
- 3) “Horseshoe” asymmetry in IR and “butterfly” in a radio image of the disk.
